Scenario 01

🔍 Search Functionality

ReWritten Prompt

Need to Create Functional Test Cases Alone
Create Positive, Negative, Edge Cases
This is a new project using Salesforce CRM. We have purchased the required Salesforce licenses to meet our business needs. Login functionality is already implemented, and search functionality has now been developed
Test Case ID | Test Description | Test Data | Test Steps | Actual Result | Expected Result |
Act as a Senior QA Engineer
Generate Test Cases in Tabular Structure
Stick with the technical Industry standard

Scenario 04

🔐 Role-Based Access Control

ReWritten Prompt

Need to Create Functional Test Cases Alone
Create Positive, Negative, Edge Cases
This is a new project using Salesforce CRM. We have purchased the required Salesforce licenses to meet our business needs, and an Admin user has already been created.
Our objective is to verify the functionality of assigning roles to users through the Salesforce Admin account and ensure that roles are assigned successfully according to the configured role hierarchy and business requirements.
Test Case ID | Test Description | Test Data | Test Steps | Actual Result | Expected Result |
Act as a Senior QA Engineer Generate Test Cases in Tabular
 Stick with the technical Industry standard is this prompt correct

Scenario 05

🌐 API Testing

"Write API test cases for user registration."

Rewritten Prompt

Need to Create Functional Test Cases Alone
Create Positive, Negative, Edge Cases

This is a new project using Salesforce CRM, for which we have purchased the required Salesforce licenses to meet our business needs. We are using Postman to execute the User Registration API. Our objective is to verify that users are successfully created in Salesforce when the API is executed and that the created user records contain the expected details.
Test Case ID | Test Description | Test Data | Test Steps | Actual Result | Expected Result |
Act as a Senior QA Engineer Generate Test Cases in Tabular Format
 Stick with the technical Industry standard

Observations

The main difference is that the rewritten prompts provide context, scope, objectives, constraints, and output expectations, while the original prompts provide only a basic instruction.

As a result, rewritten prompts generally help generate more relevant, comprehensive, and consistently structured test cases. However, a detailed prompt does not guarantee complete coverage; the requirements and expected behavior must still be clearly defined and validated.
